

# Unit 2

# Computer Arithmetic

## Lecture 1

## Number Systems

Here we discuss positional number systems with Positive radix (or base)  $r$ . A number with radix  $r$  is represented by a string of digits as below i.e. wherever you see numbers of whatever bases, all numbers can be written in general as:

## Decimal Number System (Base-10 system)

- Radix (r) = 10
- Symbols = 0 through r-1 = 0 through 10-1 = {0, 1, 2... 8, 9}
- starting from base-10 system since it is used vastly in everyday arithmetic besides computers to represent numbers by strings of digits or symbols defined above, possibly with a *decimal point*. Depending on its position in the string, each digit has an associated value of an integer raised to the power of 10.
- Example: decimal number 724.5 is interpreted to represent 7 hundreds plus 2 tens plus 4 units plus 5 tenths.
  - $724.5 = 7 \times 10^2 + 2 \times 10^1 + 4 \times 10^0 + 5 \times 10^{-1}$

## Binary Number System (Base-2 system)

- Radix ( $r$ ) = 2
- Symbols = 0 through  $r-1$  = 0 through  $2-1$  = {0, 1}
- A binary numbers are expressed with a string of 1's and 0's and, possibly, a *binary point* within it. The decimal equivalent of a binary number can be found by expanding the number into a power series with a base of 2.
- Example:  $(11010.01)_2$  can be interpreted using power series as:
- $(11010.01)_2 = 1 \times 2^4 + 1 \times 2^3 + 0 \times 2^2 + 1 \times 2^1 + 0 \times 2^0 + 0 \times 2^{-1} + 1 \times 2^{-2} = (26.25)_{10}$
- Digits in a binary number are called bits (**B**inary **d**igits).
- When a bit is equal to 0, it does not contribute to the sum during the conversion. Therefore, the conversion to decimal can be obtained by adding the numbers with powers of 2 corresponding to the bits that are equal to 1.
- Looking at above example,  $(11010.01)_2 = 16 + 8 + 2 + 0.25 = (26.25)_{10}$ .

**In computer work,**

- $2^{10}$  is referred to as K (kilo),
- $2^{20}$  as M (mega),
- $2^{30}$  as G (giga),
- $2^{40}$  as T (tera) and so on.

## Octal Number System (Base-8 system)

- Radix ( $r$ ) = 8
- Table: Numbers obtained from 2 to the power of  $n$
- Symbols = 0 through  $r-1$  = 0 through  $8-1$  = {0, 1, 2...6, 7}
- An octal numbers are expressed with a strings of symbols defined above, possibly, an *octal point* within it.  
The decimal equivalent of a octal number can be found by expanding the number into a power series with a base of 8.
- Example:  $(40712.56)_8$  can be interpreted using power series as:
- $(40712.56)_8 = 4 \times 8^4 + 0 \times 8^3 + 7 \times 8^2 + 1 \times 8^1 + 2 \times 8^0 + 5 \times 8^{-1} + 6 \times 8^{-2} = (16842.1)_{10}$

- **Hexadecimal Number System (Base-16 system)**

- Radix (r) = 16
- Symbols = 0 through r-1 = 0 through 16-1 = {0, 1, 2...9, A, B, C, D, E, F}
- 
- A hexadecimal numbers are expressed with a strings of symbols defined above, possibly, a *hexadecimal point* with in it. The decimal equivalent of a hexadecimal number can be found by expanding the number into a power series with a base of 16.
- Example: (4D71B.C6)<sub>16</sub> can be interpreted using power series as:

$$= 4 \times 16^4 + 13 \times 16^3 + 7 \times 16^2 + 1 \times 16^1 + 11 \times 16^0 + 12 \times 16^{-1} + 6 \times 16^{-2}$$

$$= (317211.7734375)_{10}$$

## Complements

- Complements are used in digital computers for simplifying the subtraction operation and for logical manipulation.
- There are two types of complements for each base- $r$  system:  $r$ 's complement and the second as the  $(r - 1)$ 's complement.
- When the value of the base  $r$  is substituted, the two types are referred to as the 2's complement and 1's complement for binary numbers, the 10's complement and 9's complement for decimal numbers etc.

### **(r-1)'s Complement (diminished radix compl.)**

(r-1)'s complement of a number N is defined as  $(r^n - 1) - N$

Where **N** is the given number

**r** is the base of number system

**n** is the number of digits in the given number

To get the (r-1)'s complement fast, subtract each digit of a number from (r-1).

#### **Example:**

- 9's complement of  $835_{10}$  is  $164_{10}$  (Rule:  $(10^n - 1) - N$ )
- 1's complement of  $1010_2$  is  $0101_2$  (bit by bit complement operation)

### **r's Complement (radix complement)**

r's complement of a number N is defined as  $r^n - N$

Where **N** is the given number

**r** is the base of number system

**n** is the number of digits in the given number

To get the r's complement fast, add 1 to the low-order digit of its (r-1)'s complement.

#### **Example:**

- 10's complement of  $835_{10}$  is  $164_{10} + 1 = 165_{10}$
- 2's complement of  $1010_2$  is  $0101_2 + 1 = 0110_2$

# Subtraction with complements

- The direct method of subtraction in elementary schools uses the borrow concept.
- When subtraction is implemented with digital hardware, this method is found to be less efficient than the method that uses complements.
- The subtraction of two  $n$ -digit unsigned numbers  $M - N$  in base- $r$  can be done as follows:
  1. Add the minuend  $M$  to the  $r$ 's complement of the subtrahend  $N$ . This performs
    - $M + (r^n - N) = M - N + r^n$ .
  2. If  $M \geq N$ , the sum will produce an end carry,  $r^n$ , which is discarded; what is left is the result  $M - N$ .
  3. If  $M < N$ , the sum does not produce an end carry and is equal to  $r^n - (N - M)$ , which is
    - the  $r$ 's complement of  $(N - M)$ . To obtain the answer in a familiar form, take the  $r$ 's complement of the sum and place a negative sign in front.

Example I:

Using 10's complement, subtract  $72532 - 3250$ .

$$\begin{array}{rcl} M & = & 72532 \\ 10\text{'s complement of } N & = & + \underline{96750} \\ \text{Sum} & = & 169282 \\ \text{Discard end carry } 10^5 & = & - \underline{100000} \\ \text{Answer} & = & 69282 \end{array}$$

Example II:

Using 10's complement, subtract  $3250 - 72532$ .

$$\begin{array}{r} M = \quad 03250 \\ 10\text{'s complement of } N = \quad + \underline{27468} \\ \text{Sum} = \quad 30718 \end{array}$$

There is no end carry.

Answer:  $-(10\text{'s complement of } 30718) = -69282$

Perform the following (r's complement)

1.  $234 - 1278$

2.  $1234 - 567$

3.  $345 - 1356$

4.  $1789 - 367$
